

Assembly of long, error-prone reads using repeat graphs

Mikhail Kolmogorov, Jeffrey Yuan, Yu Lin, and Pavel A. Pevzner

July 1, 2021

Johannes Hausmann, Luis Kress

Background

- Assembly: reconstruct target sequence from the reads

Background

- Assembly: reconstruct target sequence from the reads
- Different assemblers, different graph structures

Background

- Assembly: reconstruct target sequence from the reads
- Different assemblers, different graph structures
- Repeats → assembly fragmentation

Figure 1: Tangled assembly graph[1]

Background

- Assembly: reconstruct target sequence from the reads
- Different assemblers, different graph structures
- Repeats → assembly fragmentation

Figure 1: Tangled assembly graph[1]

- Small differences between repeat copies → hard to resolve with error-prone reads

- Most assemblers spend much time on correct contig assembly

Disjointigs

- Most assemblers spend much time on correct contig assembly
- Flye uses a different approach [1]:

- Most assemblers spend much time on correct contig assembly
- Flye uses a different approach [1]:
 - we don't care

Disjointigs

- Most assemblers spend much time on correct contig assembly
- Flye uses a different approach [1]:
 - we don't care (at least at the initial stage)

- Generate paths from overlapping reads without checking for correct repeat resolution → Disjointigs

Appendix

Dot plot creation

-	9	10	-	-	9	10	-	-	5	6
8	5	6	-	-	1	2	-	0	1	2
0	1	2	3	4	5	6	7	8	9	10
A	C	T	G	G	C	T	G	A	C	T

Figure 3: Dot plot creation

Repeat graphs

- generalization of de bruijn graphs
- structure
- creation
 - from disjointigs = random walk of reads on the repeat graph
 - means the repeat graph hasn't to be known

Difference repeat graph de Bruijn graph

- A-Bruijn graph (alignments) generalizes the de Bruijn graph
- "We thus argue that the time has come to explain that the breakpoint graphs and the de Bruijn graphs are two identical data structures (if one ignores a cosmetic difference between them) as they both represent specific instances of a general notion of the A-Bruijn graph introduced in [2]. The A-Bruijn graphs are based on representing genomes as sets of labeled paths and further gluing identically labeled edges (breakpoint graphs) or vertices (de Bruijn graphs) in the resulting paths."
[3]
- de Bruijn graphs need correct bases
- otherwise tangled graph

Segmental duplications

Figure 4: Segmental Duplications

- Segmental duplications are duplicated blocks of genomic DNA typically ranging in size from 1-200 kb (IHGSC 2001)
- They often contain sequence features such as high-copy repeats and gene sequences with intron-exon structure.

Contigity improvement

Figure 5: Contigity improvements

- colors are contigs → change in color means fragmentation
